

- Clinical candidate for the treatment of hepatitis C from Merck
 - Nucleoside-based prodrug
- Novel application of the synthesis of pronucleotide (ProTide) 5'-phosphoramidate monoesters promoted by aluminum-based Lewis acids
- Key developments are purity control and handling of pyrophoric reagent on scale
- Methodology provides high diastereoselectivity

Original Process:

Crystallizations:

1. 8 vol EtOAc
2. Heat to 70 °C
3. Cool to rt
4. Filter
5. 8 vol EtOAc
6. Heat to 70 °C
7. Cool to rt
8. Filter

Workup:

1. 8 vol PhMe
2. 5 vol 2 N HCl
3. 3 vol 2 N HCl
4. 3 vol 2 N HCl
5. 3 vol H₂O
6. 3 vol 5% K₂CO₃
7. 3 vol 5% K₂CO₃
8. Back extraction of 5, 6, and 7 with PhMe/THF

Uprifosbuvir crude
50% IY

IPA
heptane
90%

Improved Process:

Workup:

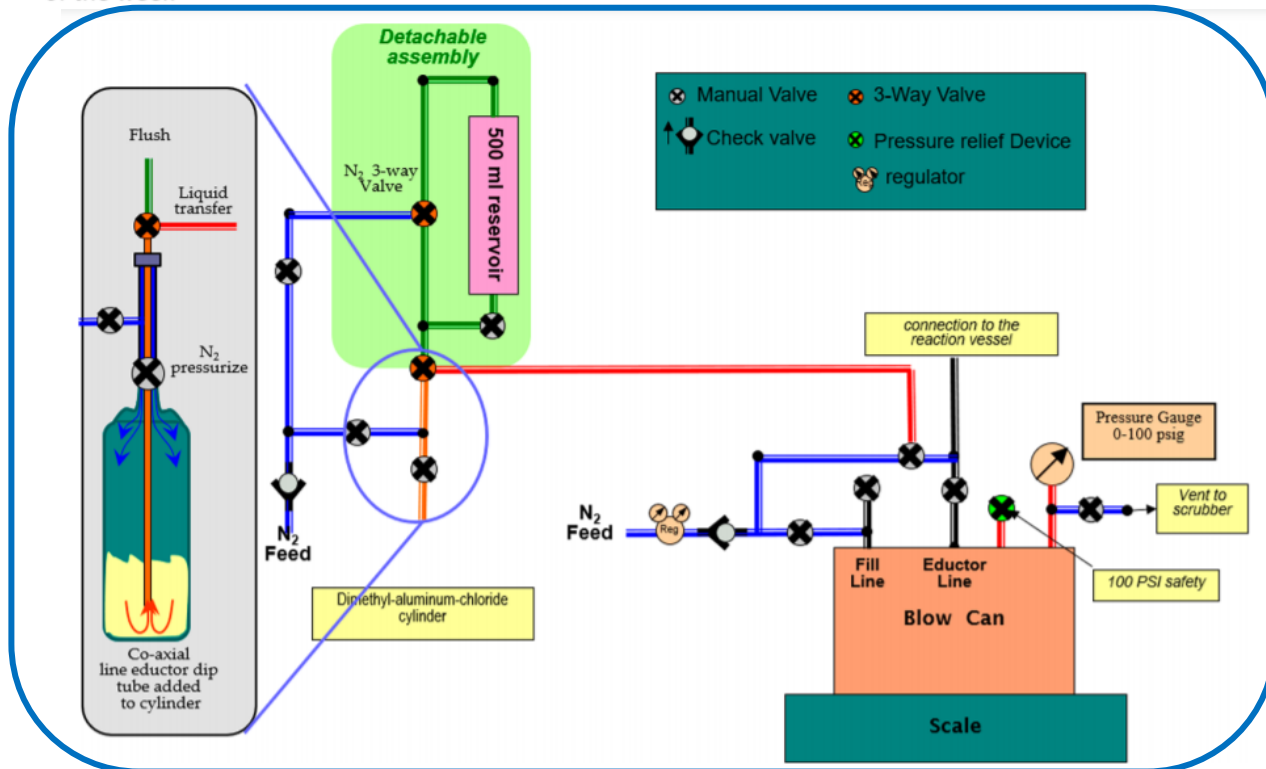

1. 5 vol 30 wt% aq tartaric acid
2. 3 vol isopropyl acetate
3. 5 vol 3 wt% NaCl (aq)
4. 5 vol 3 wt% NaCl (aq)

Crystallizations:

1. 8 vol IPA
2. Heat to 60 °C
3. Filter
4. 8 vol heptane
5. Cool to 20 °C

81% IY

- Neat Me₂AlCl transferred from a cylinder into a blow can containing the desired amount of heptane to reduce its interaction with air and moisture
- Slow charging to the reactor containing a THF solution of the other reaction components under moderate pressure at 0 °C followed by line flushing with heptane to prevent any buildup of Me₂AlCl
- Aging rt 12 h before heating to 50 °C for 3 h substantially improved overall conversion and maintained high diastereoselectivity
- Tartaric acid workup eliminates need for second crystallization
- Increase in reaction temperature lead to a significant increase in impurity formation
